

RAGFlow Test Document

Introduction

RAGFlow is a multi-agent RAG pipeline that ingests PDF documents and answers natural-language queries with cited responses. It uses LangGraph for orchestration, Qdrant for vector storage, and Gemini for LLM inference.

Technical Architecture

The system consists of five nodes: query rewriter, retriever, reranker, answer generator, and citation formatter.

Performance Metrics

Target response time is under 2 seconds on local hardware. Cohere reranking improves NDCG@5 by 30-40 percent compared to raw cosine similarity.
